Analysis of Algorithms
Assignment 03

1. Implement the Towers of Hanoi as a recursive algorithm and as an iterative algorithm. Compare the computational complexity of the algorithm with the mathematical analysis and with the empirical analysis techniques discussed during the lecture. Mathematical analysis was already done in class. Check for consistency between both methods.
2. Apply empirical analysis to the “linear congruential method” for creating pseudo-random numbers. Research about the algorithm, the textbook gives some information to start up with.

Submission

Upload your solutions as a PDF file. In case of coding assignments, upload to GitHub and include the link in the PDF file. Your submission should include screenshots of the execution of your code when applicable.
